

# Five diseases your kitten's vaccines can prevent

## Core vaccines included in Pet Health Club®

- 1 Feline herpesvirus and calicivirus**  
These viruses cause cat flu, which can lead to serious breathing issues and, sometimes, long-term illness or death.
- 2 Feline infectious enteritis**  
This virus spreads easily, causing vomiting, diarrhoea, and dehydration, and can even be deadly.
- 3 Feline leukaemia virus (FeLV)**  
Weakens the immune system, putting cats at risk of severe infections and illnesses.

## Non-core vaccines to consider

- 4 Chlamydia felis**  
Can cause painful eye infections, but not all cats are at risk — your vet can advise if the vaccine is needed.
- 5 Rabies**  
The UK is rabies-free, but this virus is almost always fatal once symptoms appear — a vaccine is needed if travelling abroad.
